Talk Outline

- Motivation
- Vision
- The Greek legislation platform Nomothesi@
- Reengineering Diavgeia
- Conclusions and Future Work

Motivation

- The current state of the art in the Greek public sector amounts to a lot of **paper** and **PDF** or **Word** documents.

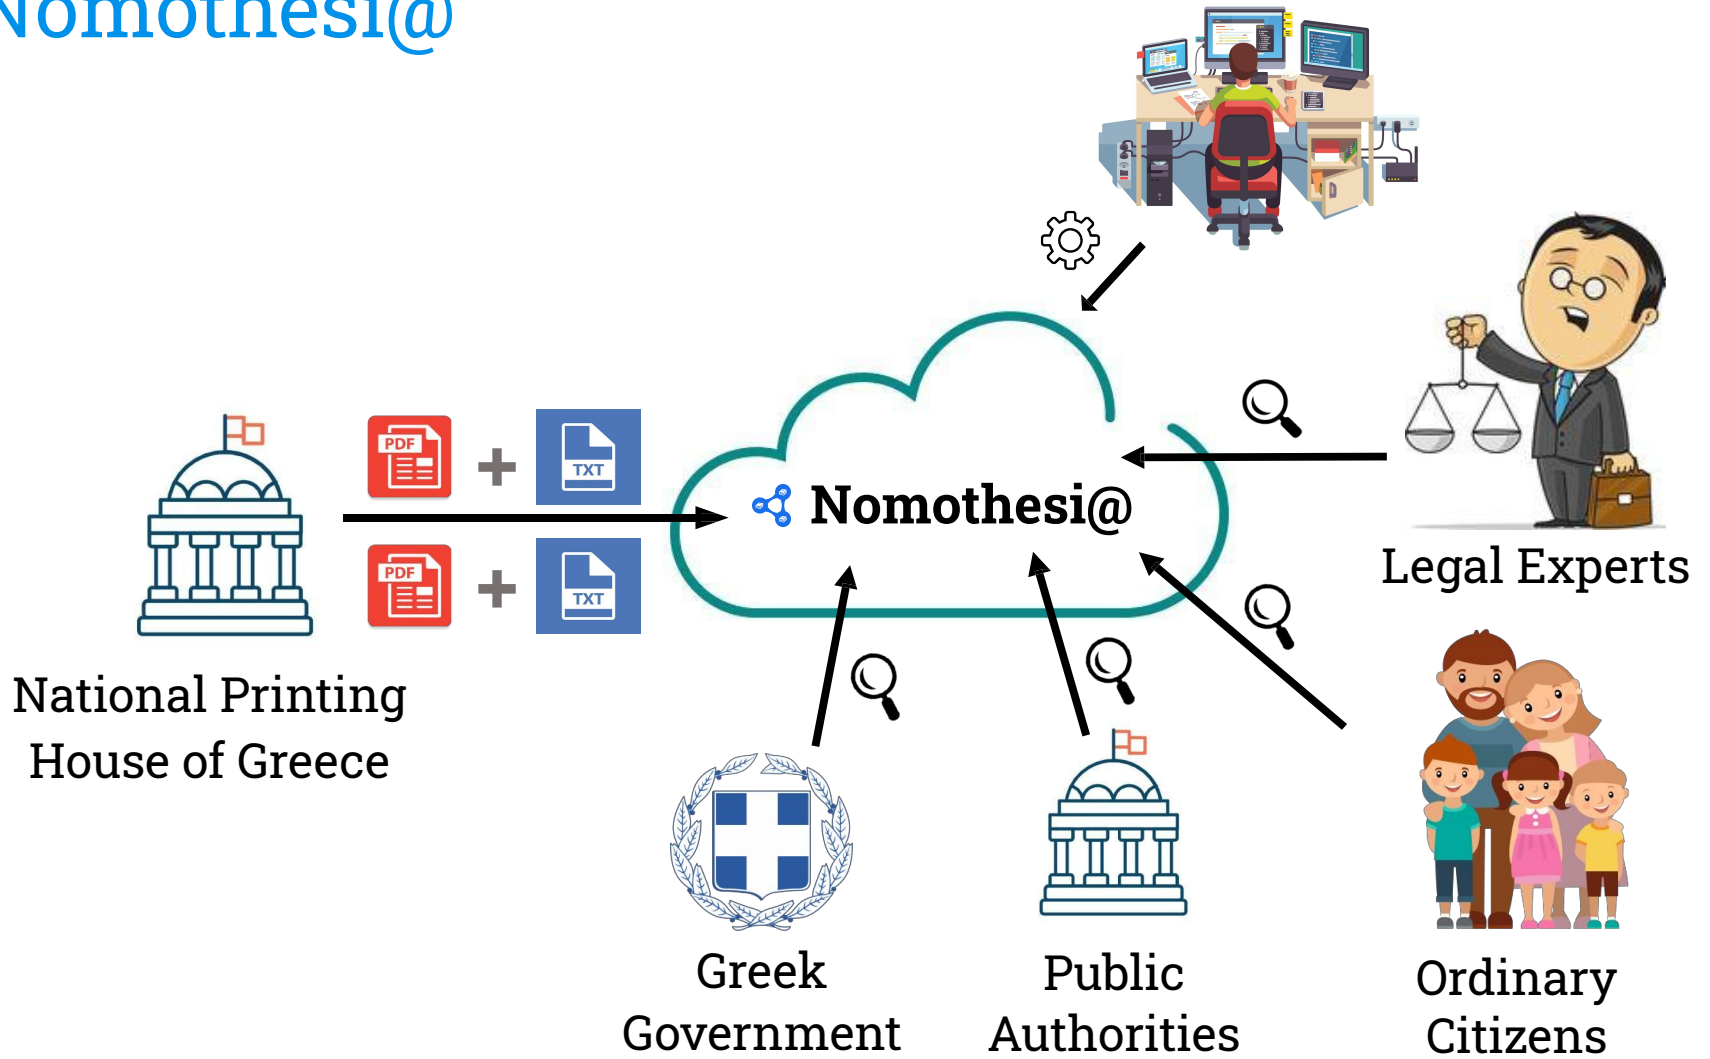

Vision

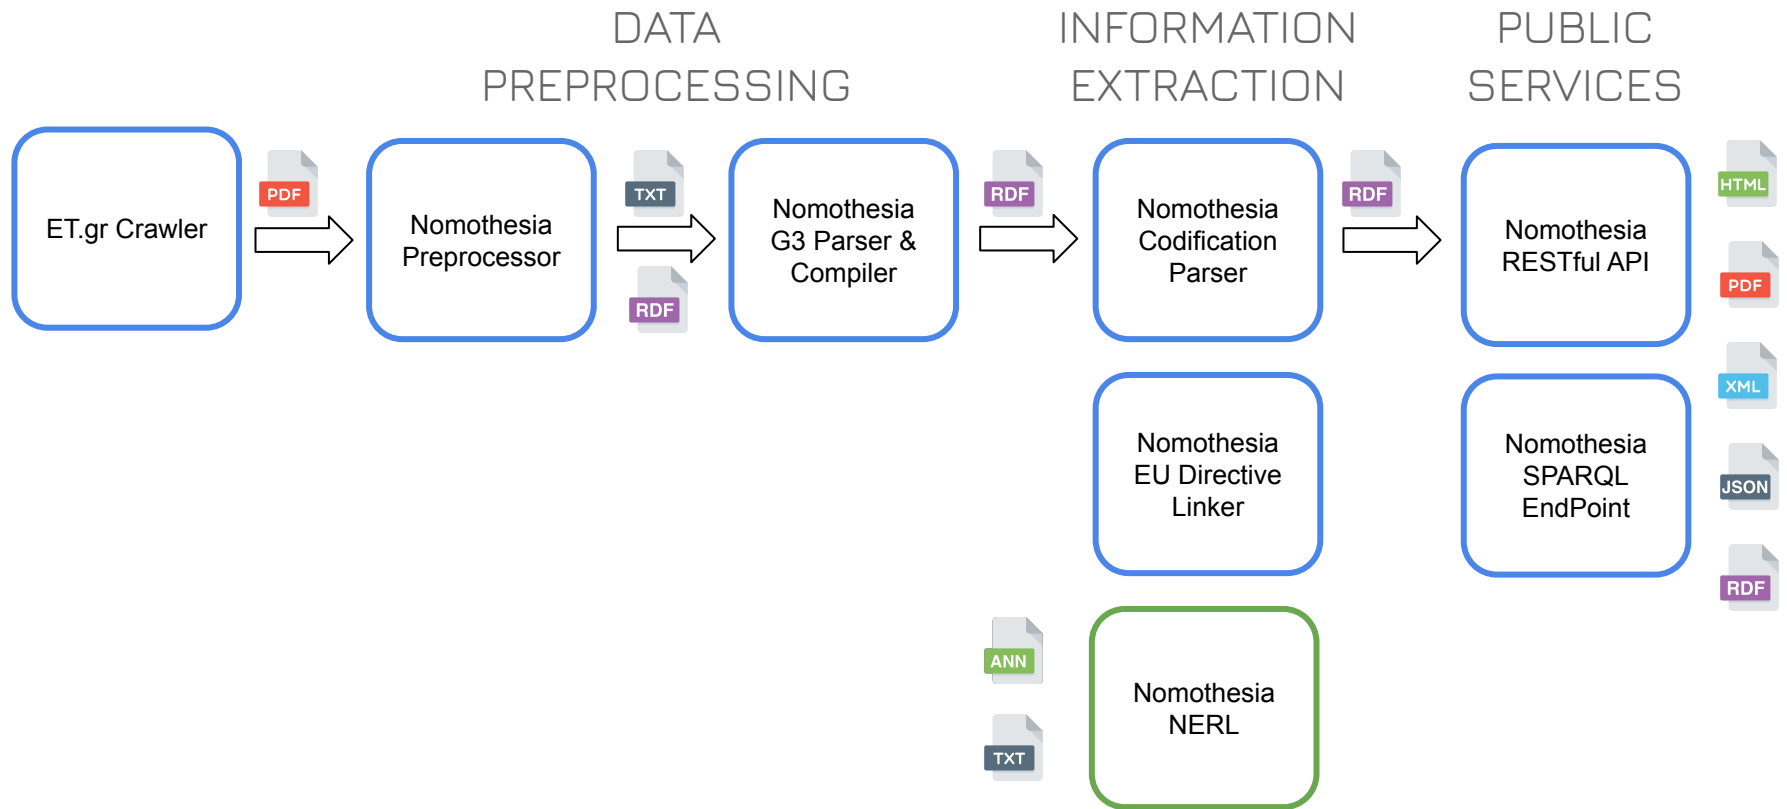

- Our vision is to go beyond the current state of the public sector to one which is **decentralized, trusted, intelligent and linked using Artificial Intelligence technologies**.
- We are developing technologies that make public sector information available on the **Web as linked data** so that it can be exploited by its users (e.g., public sector employees, professionals, software developers and ordinary citizens).

Nomothesi@

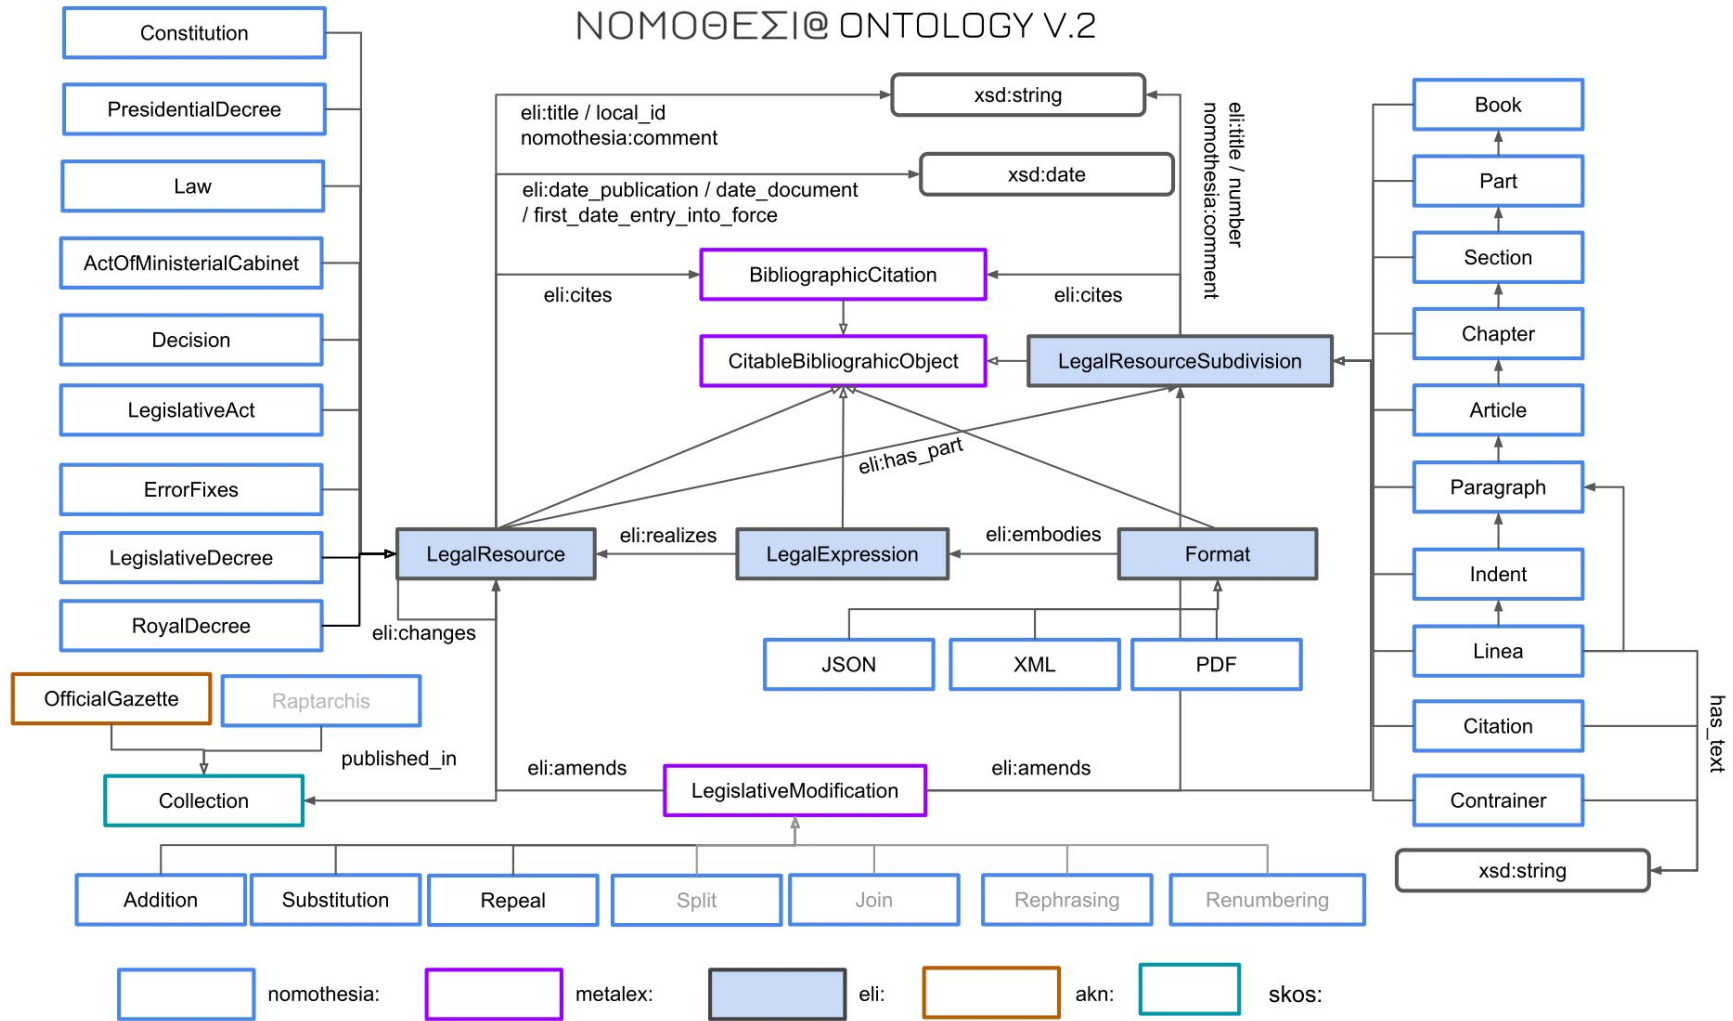

Pipeline - Nomothesi@

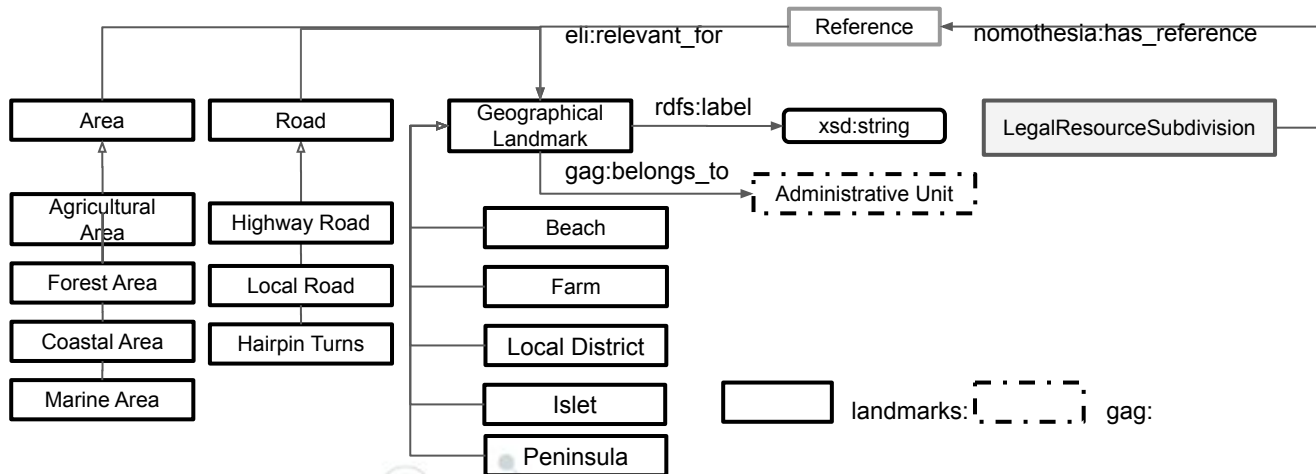

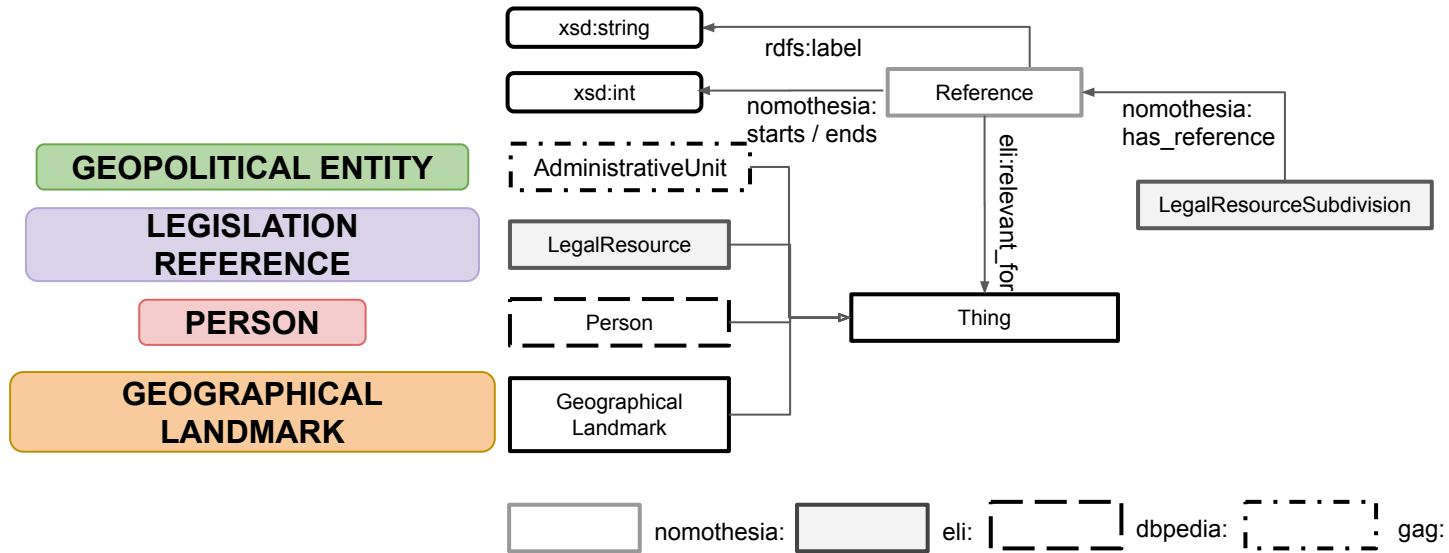

Ontology - Nomothesi@ (ELI)

NOMOΘΕΣΙ@ ONTOLOGY V.2

Ontology - Nomothesi@ (Entities)

Persistent URI: <http://legislation.di.uoa.gr/entity/{typeofentity}/{id}>

Greek legislation is now 5-star open linked data forming the Greek legal knowledge graph

Some numbers

- We provide all legal documents of issues A and D of the FEK for the years 1990-2019, the penal and civil code of Greece and all European directives and treaties extracted from EUR-Lex in Greek.
- 12.000 legal documents.
- 195.000 references to entities.
- 5 million RDF triples in the Greek legal knowledge graph.

AI technologies used

- Ontologies and knowledge graphs
- RDF, SPARQL, linked data
- Entity recognition and disambiguation using deep neural networks (LSTMs)

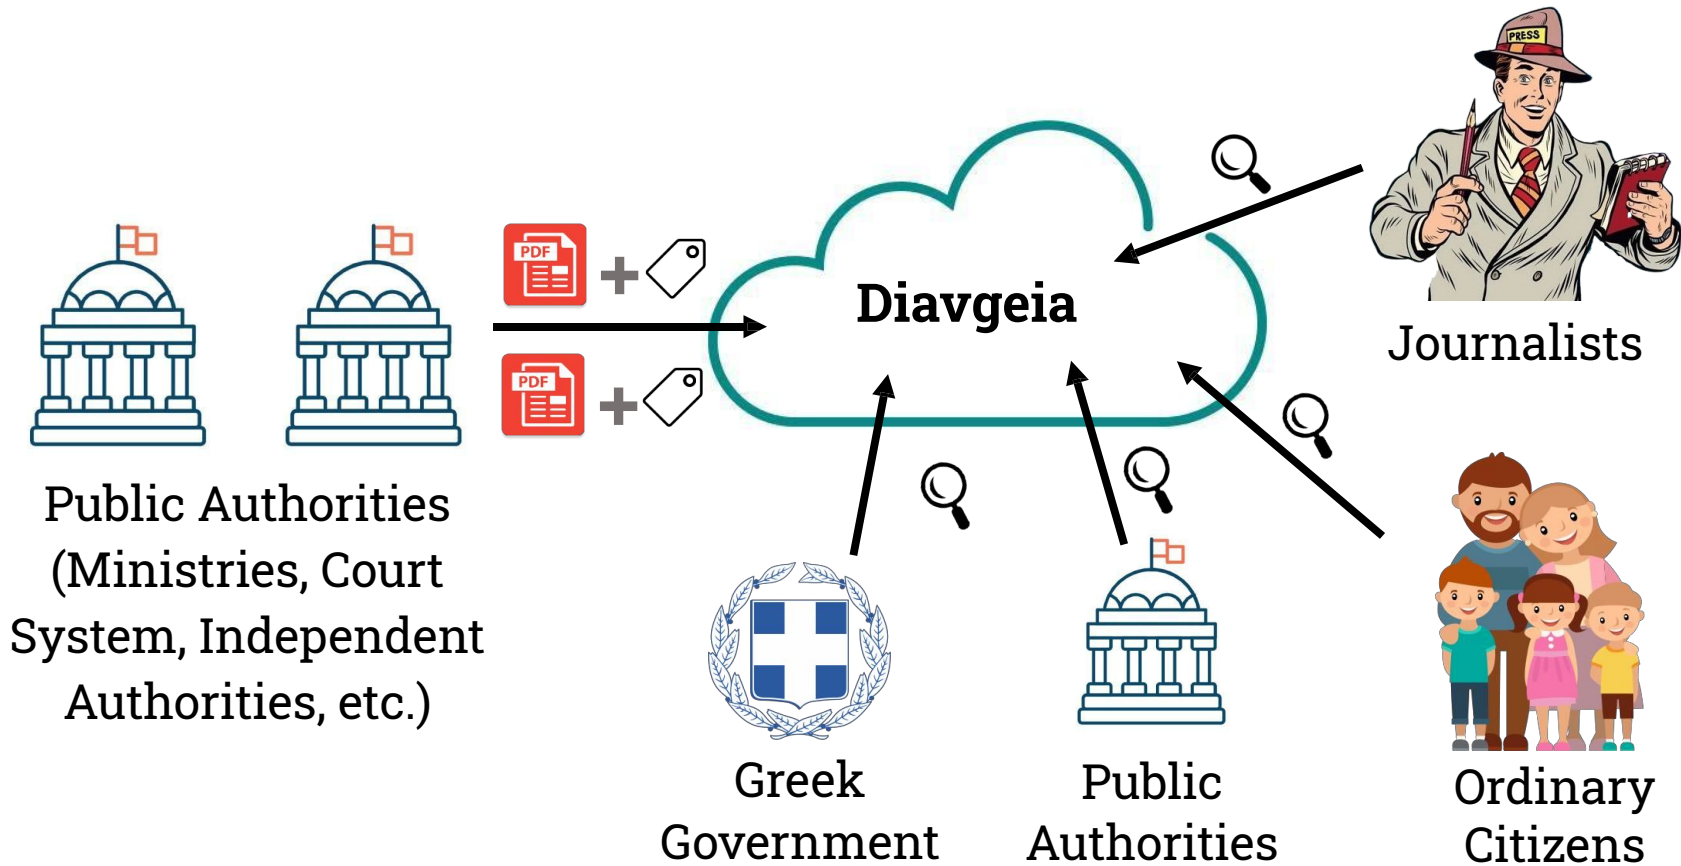

Nomothesi@: why it is important?

- Information discovery or application development is just a few SPARQL queries away.
- Example queries:
 - Find all laws and their revisions that refer to geographical areas affected by the Peloponnese fires of 2007.
 - Find all laws signed by a minister that refer to the administrative area which he or she represents.
- Points the way for the **use of AI technologies in the production of legislation.**

Diavgeia: The Greek Transparency portal (current state)

Four problems of the current implementation

1. The decisions are PDF files which follow no structuring of their textual content → Keyword search
2. The decisions also make references to the Greek legislation → How can we be sure that the decisions are taken according to the law (e.g., that legislative references exist)?
3. Possible Metadata – Text Document inconsistency
4. No integrity mechanism which ensures the immutability of all decisions over time

Our goal:

Diavgeia Redefined

A reengineering of Diavgeia to solve these problems,
using Semantic Web Technologies and
Permissionless Blockchains

The decisions follow a common pattern:

Appointment of R.F. as Full Professor

In accordance with:

1. The provisions of Law 3549/2007, article 25, paragraph 1.
2. The provisions of Presidential Decree 2011/54.
3. The provisions of Law 4386/2016, article 70, paragraph 4.

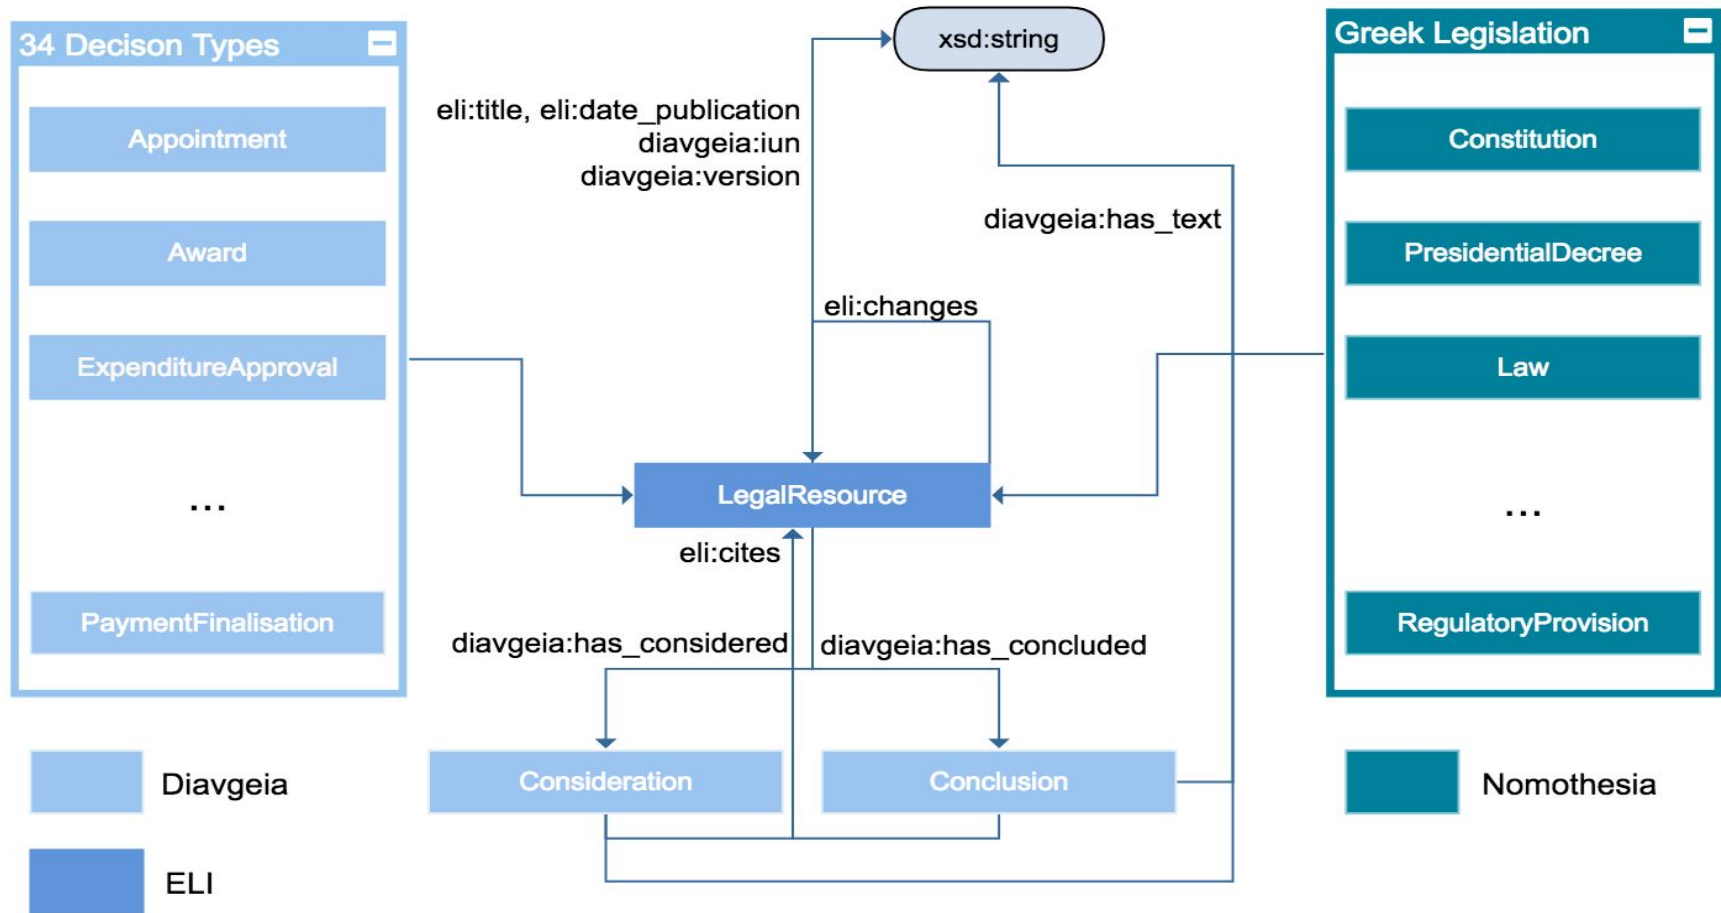

We decide:

1. The appointment of R.F. as Full Professor at the X department, at the Y university, on the subject of “Semantic Web”.

The decision is also assigned a unique **Internet Uploading Number (IUN)** and **Version token** that are its identifiers.

Appointment is 1 out of **34** different decision types that a public authority may upload on the transparency portal.

DiavgeiaRedefined Ontology

Persistent URI: <http://www.diavgeia.gov.gr/eli/{iun}/{version}>

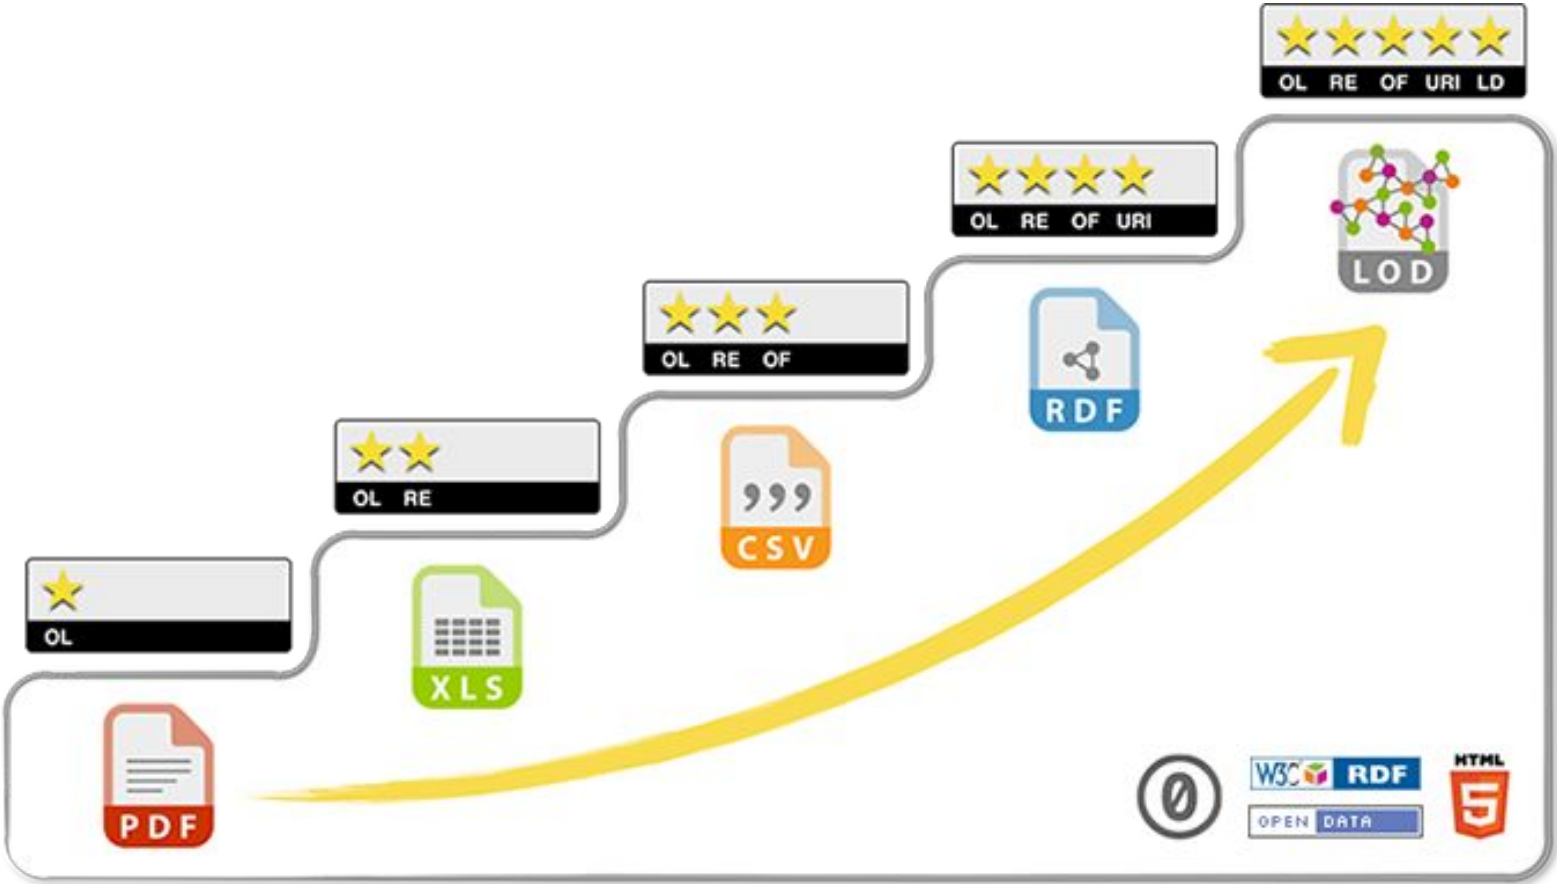

121 different properties to cover all the particularities of different decision types.

Web Editor: A tool to author the decisions

- This tool is used exclusively by the public sector authorities.
- The Web Editor is a well-structured HTML form that authorities use to write online their decisions → The entities of the HTML form are mappings to the properties of the Diavgeia ontology.
- Upon the form submission, the decision is stored both as a compressed Notation3 file in the filesystem of Diavgeia and in Jena Apache's triple store.
- **Interlinking** with other public sector datasets (Nomothesia and administrative geography dataset of Greece).

Decisions are now 5-star open linked data

Visualizer

A decorative network diagram in the top right corner, consisting of various sized circles (nodes) connected by thin lines (edges). Some nodes are solid grey, while others are hollow with a grey outline. The connections form a complex, interconnected web.

- This tool is used both by the public sector authorities and citizens.
 - Provides a visualization of the RDF decisions inside a Web browser → The entities of the RDF decisions are mappings to HTML entities.
- 
- A decorative network diagram in the bottom left corner, similar to the one in the top right, featuring a mix of solid and hollow nodes connected by lines.

Experimental results: Disk Space reduction

Diavgeia hosted over 26 million PDF decisions when we did our implementation.

- Disk space limitations.

Sample consisting of equivalent PDF and compressed Notation3 files.

- Compressed Notation3 files → x86 disk space reduction.

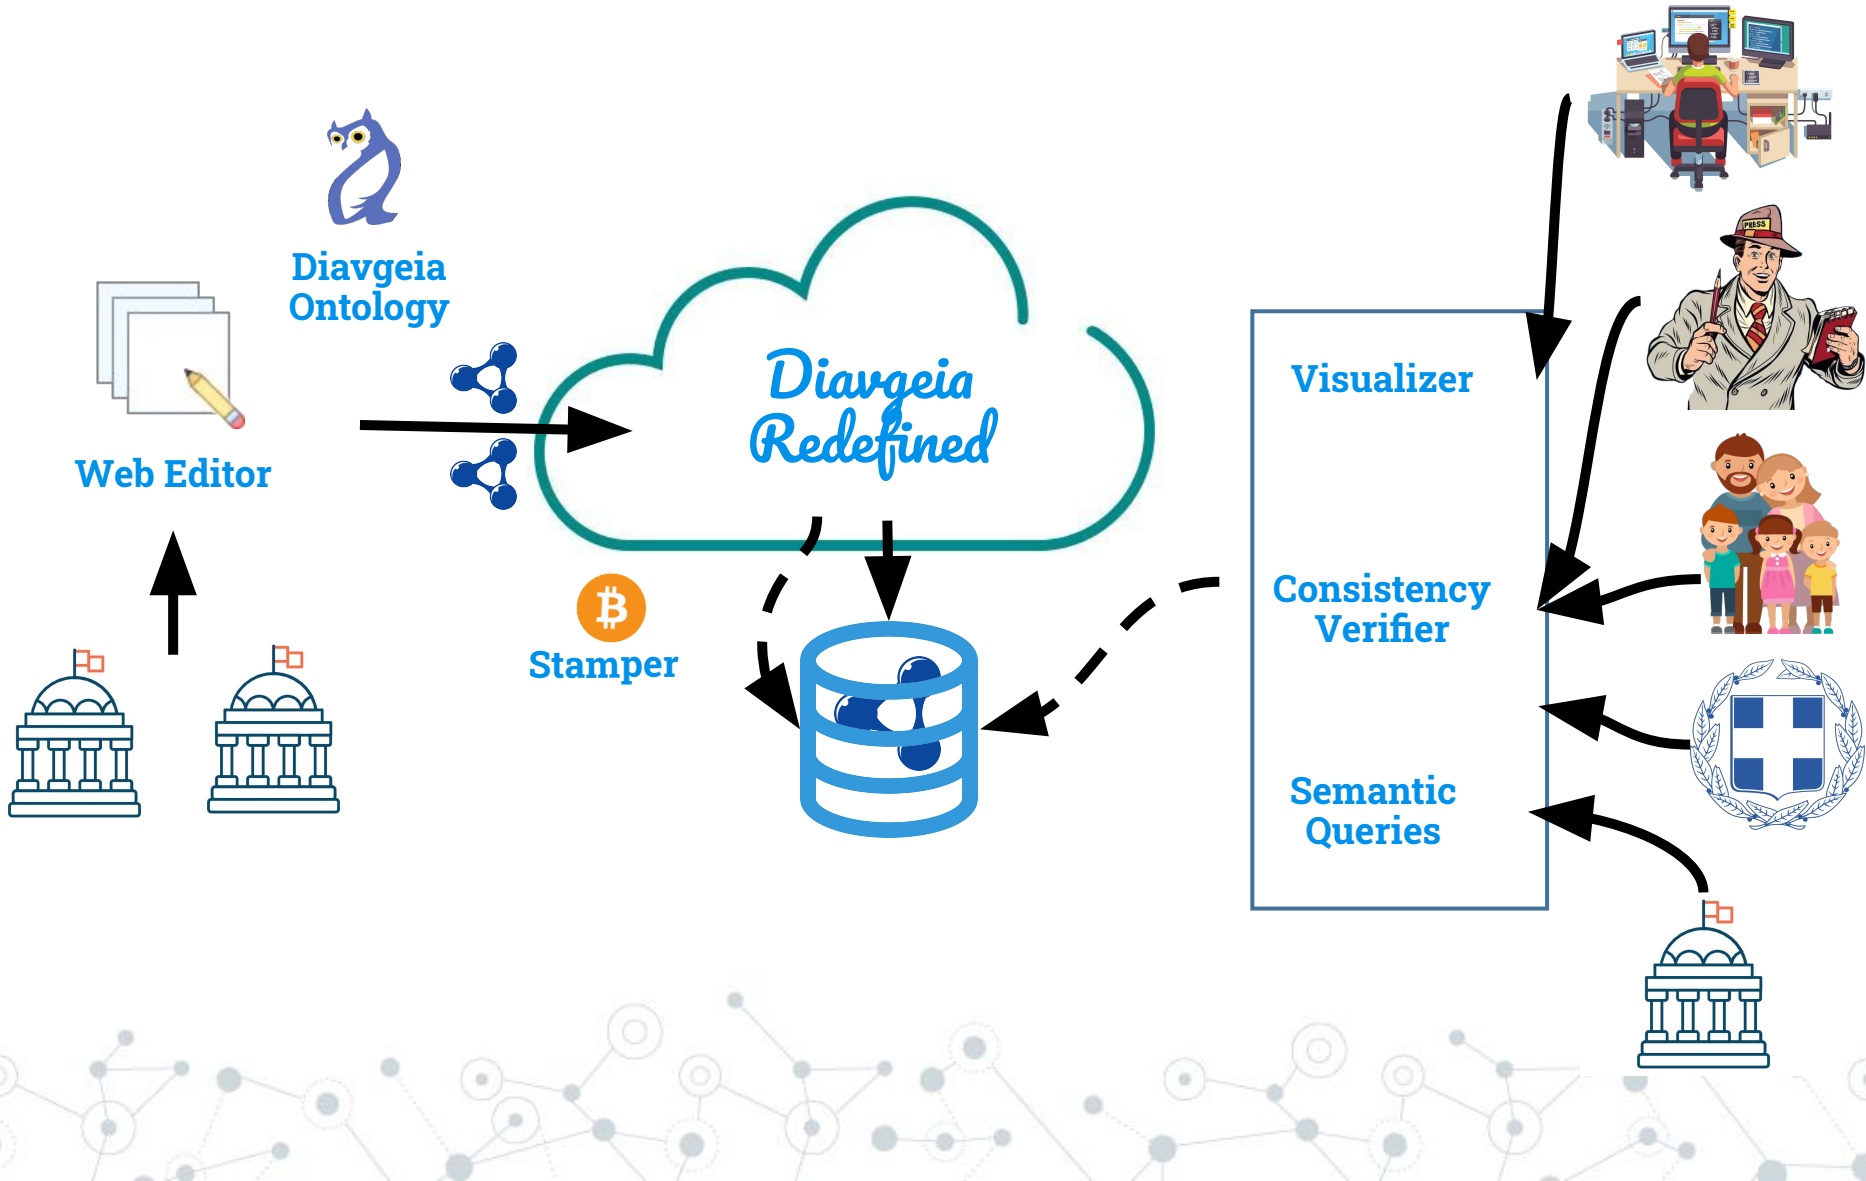

Blockchain tools

- **Stamper**: stores decisions expressed in RDF on Bitcoin blockchain
- **Consistency Verifier**: verifies the immutability of the decisions

Details omitted.

Diavgeia Redefined in a nutshell

Lessons Learned (*socially*)

- Bringing new technologies to the public sector in Greece is very difficult (fighting in the trenches!).
- We will keep working on systems which positively disrupt the public sector.
- Knowledge of AI technologies may makes the public more supportive but also more worried.
- Teaching AI techniques at universities is beneficial.
- Collaborate with researchers from other disciplines when developing technologies for the public sector.

Future Work

Nomothesia

- Implementation of QA systems, chatbots.
- Extract geospatial information from FEKs (project Chronomothesia).

DiavgeiaRedefined

- Use other underlying blockchain technologies (e.g., Ethereum).
 - Transaction cost
- Full verification procedure to ensure the data integrity of the SPARQL endpoint.

Thanks!

Any questions?
